Capital Project Profile: Whiting – Custer Transmission Line Rebuild

ITC Michigan will rebuild approximately 10 miles of its Whiting - Custer 120,000 volt (120kV) transmission line, upgrading it to 230kV capacity to support future growth in the region. This project will improve the reliability of high-voltage electrical service in the area by replacing the current structures with double-circuit steel monopoles. Construction is scheduled to begin in Q3 2019 and be completed in Q4 2019.

The Whiting - Custer line rebuild is an example of ITC's ongoing commitment to the operational efficiency and reliability of Michigan's high-voltage transmission grid. The company has invested more than \$4 billion in capital project maintenance and transmission infrastructure improvements in Michigan since 2003. These investments are improving the reliability and safety of the transmission infrastructure while ensuring its ability to meet new energy demands.

ITC Holdings Corp., through subsidiaries ITC *Transmission* and Michigan Electric Transmission Company, LLC, owns and maintains more than 8,700 circuit miles of high-voltage electric lines and 283 transmission stations and substations throughout Michigan's Lower Peninsula. As the nation's largest independent electric transmission company, ITC focuses solely on electric transmission to enhance reliability, relieve electric transmission congestion and connect all energy resources, including renewables, to customers in a non-discriminatory manner. ITC has been making significant investments in Michigan's transmission grid to improve reliability, safety and efficiency and lower the overall cost of delivered energy.

The new Whiting - Custer poles will be similar to the one shown at left.
